

Example:

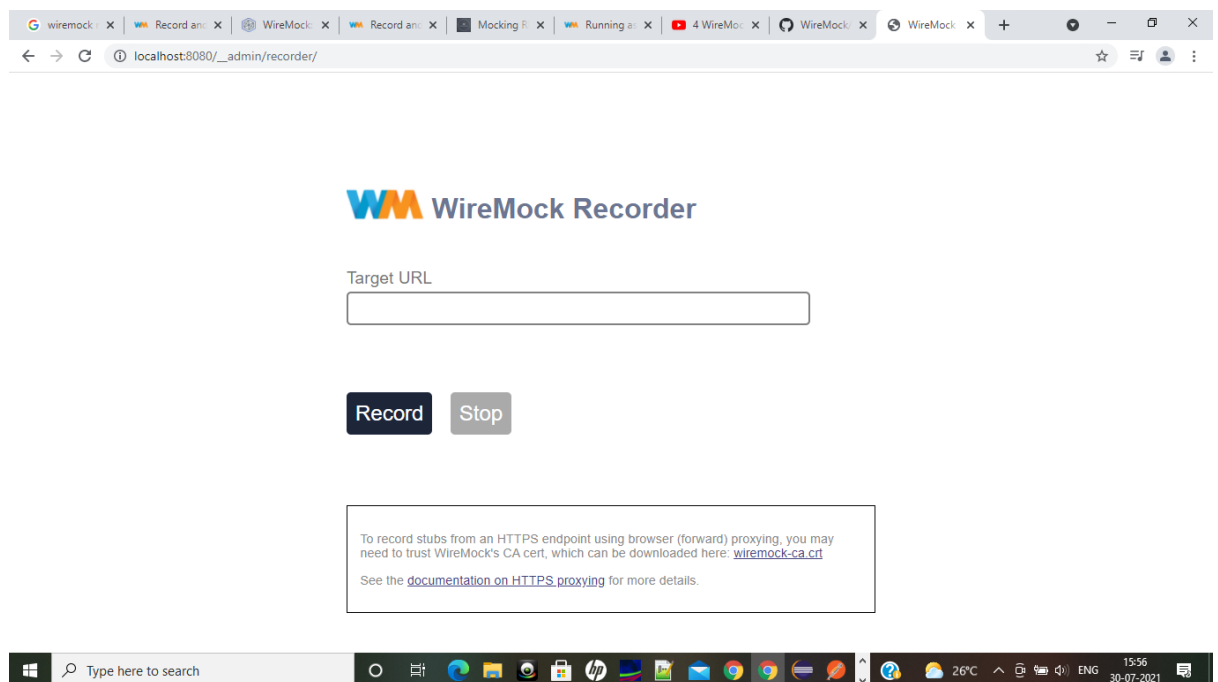

- i) I have a login application that was running on port **8082**. for fetching the customer details i am using below url. It is using post method,

<http://localhost:8081/find/v1/findByUserId>

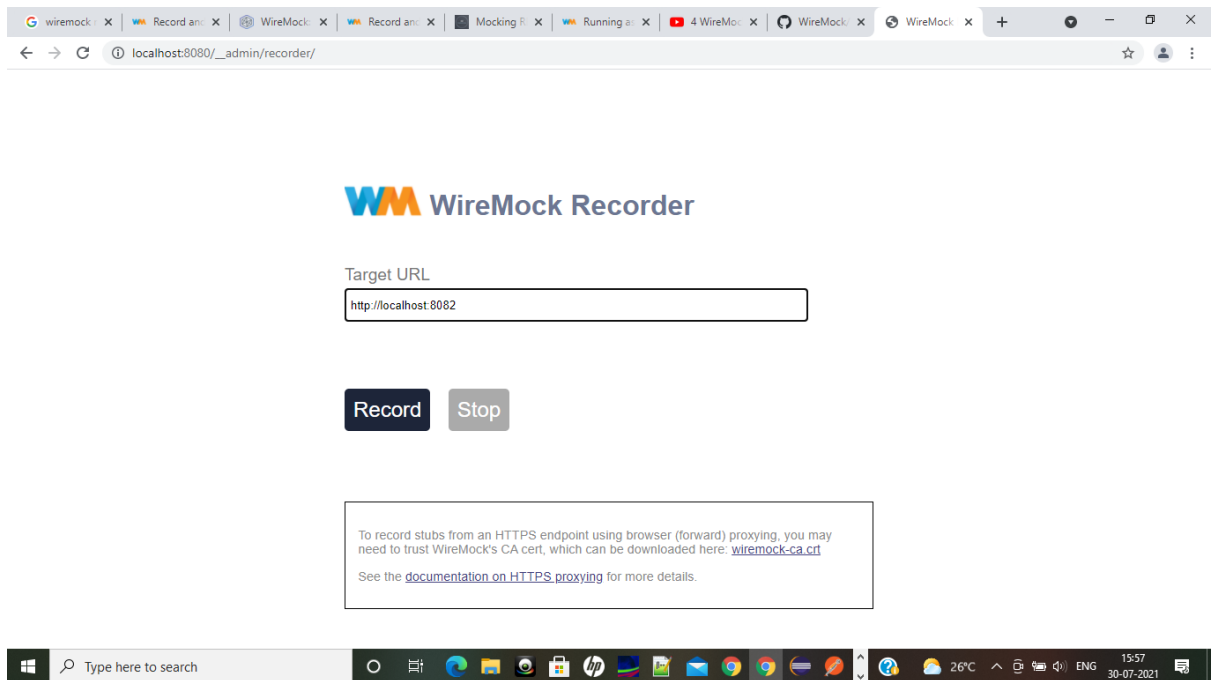

- ii) My wire mock server running on **8080** port.

Steps to record the request and response from postman.

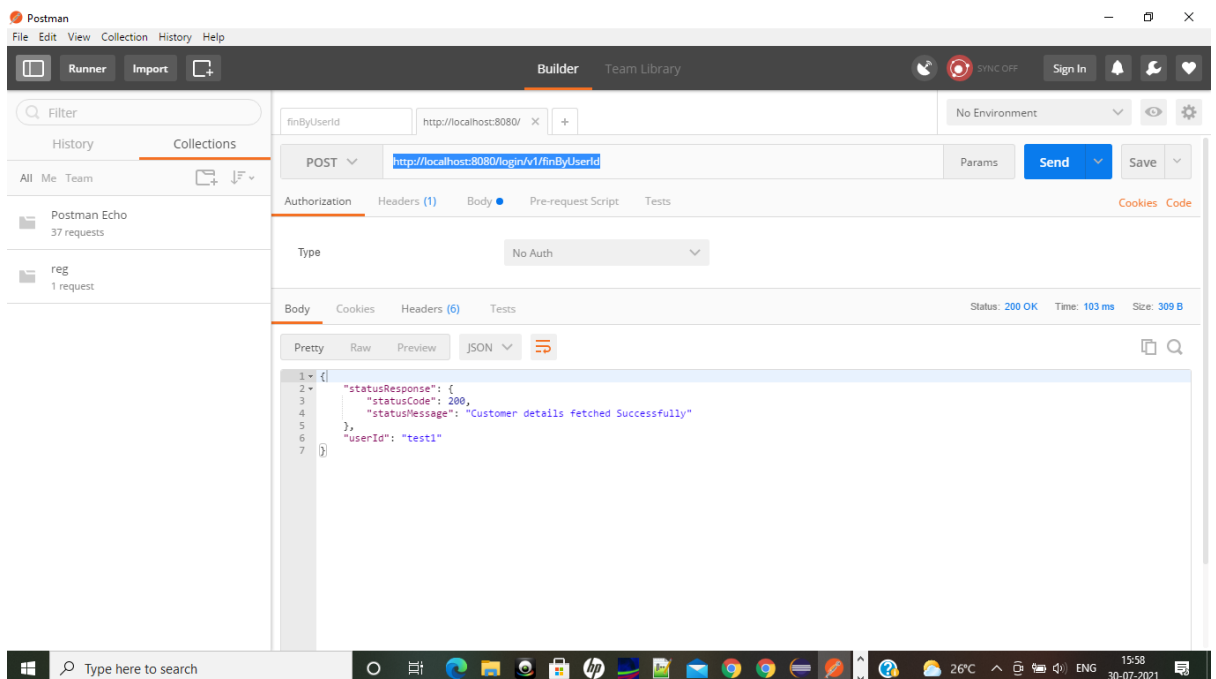

1. Hit this url (http://localhost:8080/_admin/recorder/)

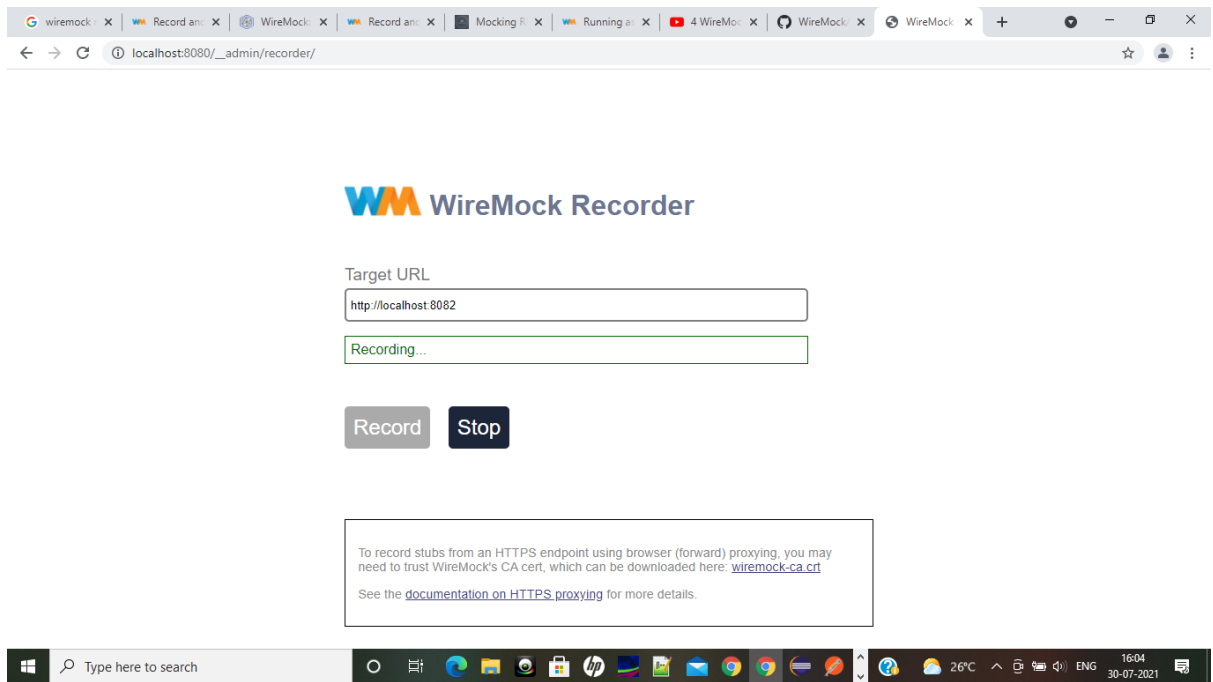

2. In the above screen in place of target url give the micro service url till <http://localhost:8081>

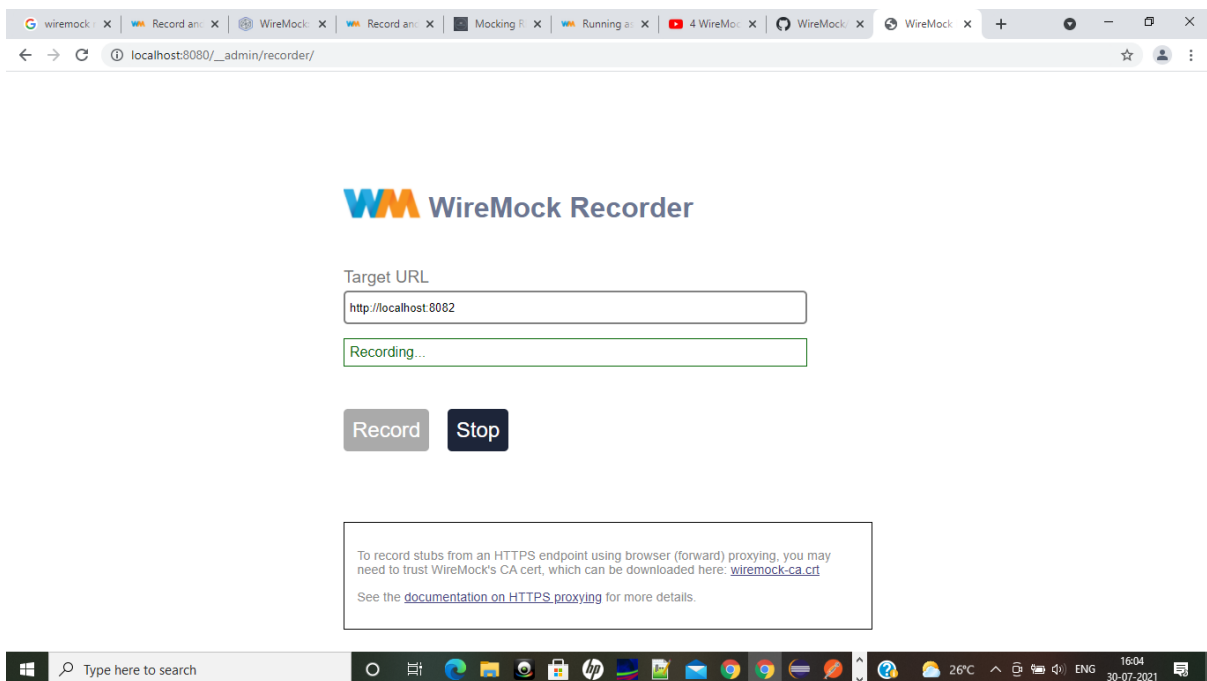

3. Click on record in above screen.
4. In the post man we need to hit the micro service with wire mock server url (<http://localhost:8080/find/v1/finByUserId>)

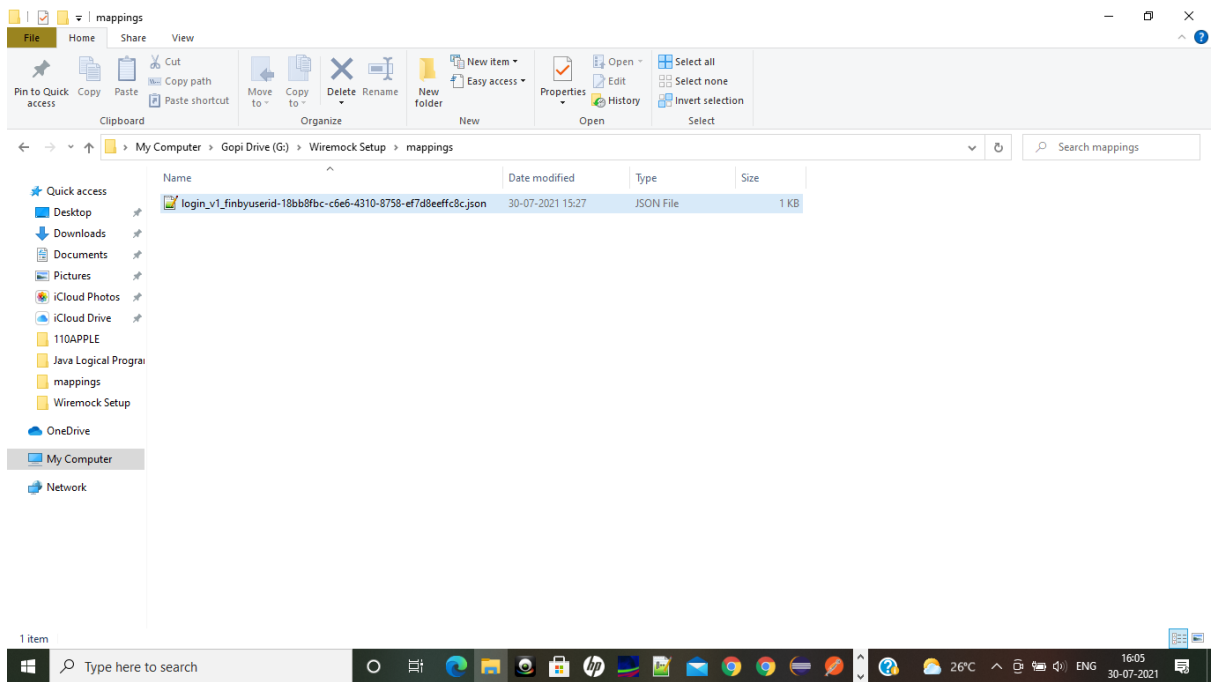

5. Stop the Recording in wire mock server

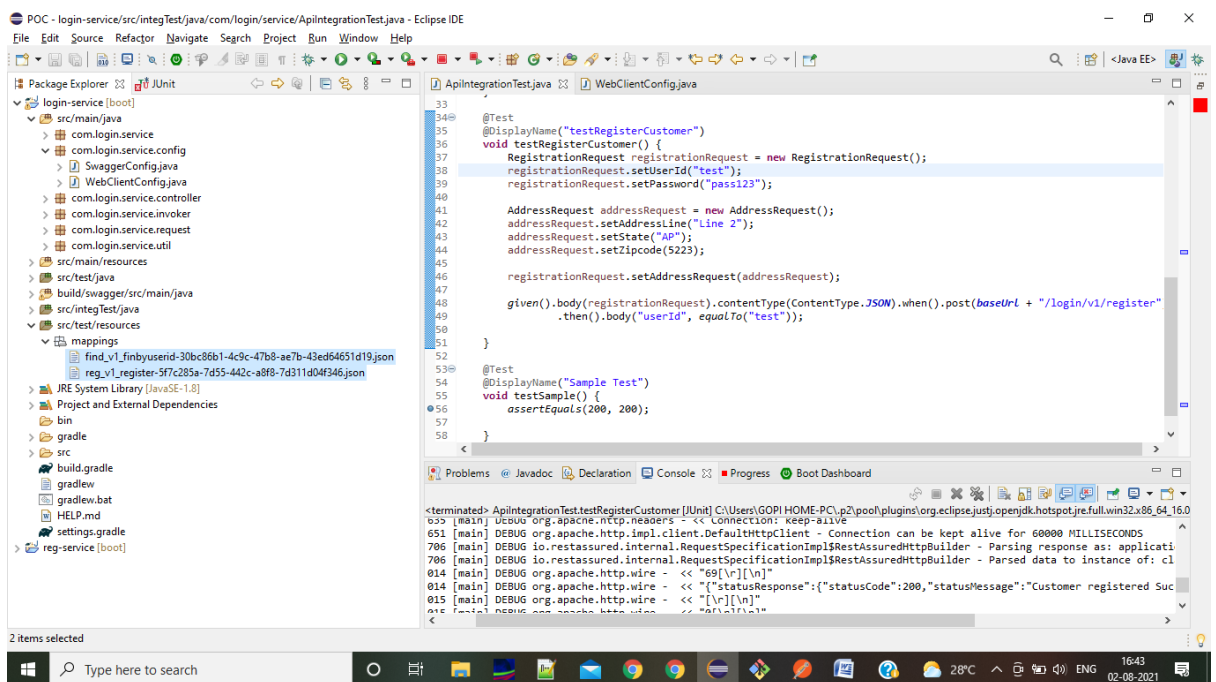

6. You could see one recording captured,

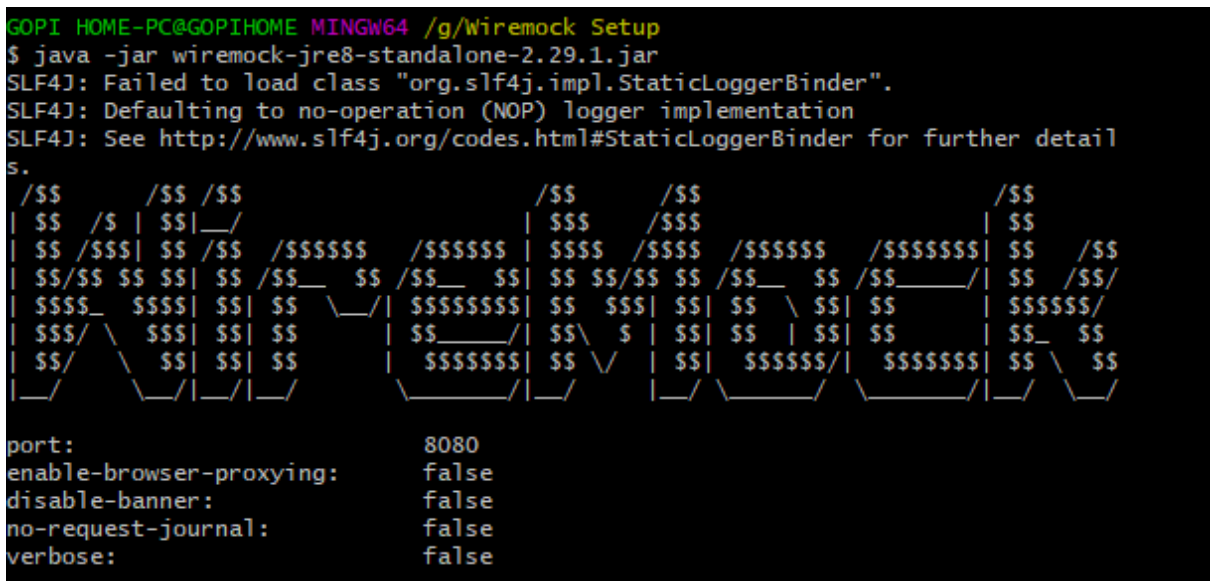

7. You could see the recorded json in mappings folder, where we are running the wire mock server

8. For adding the integration test cases we added rest-assured api.
9. My Services are running in these ports **login-service(8082), reg-service(8081) and wire mock server on 8080**. My requirement is to invoke the **reg-service** from **login-service** without invoking actual reg-service instead of wire mock server.
10. Recorded reg-service request and response with the help of wire mock recorder.
11. Pasted above recording in login-service **src/test/resources/mapping** folder

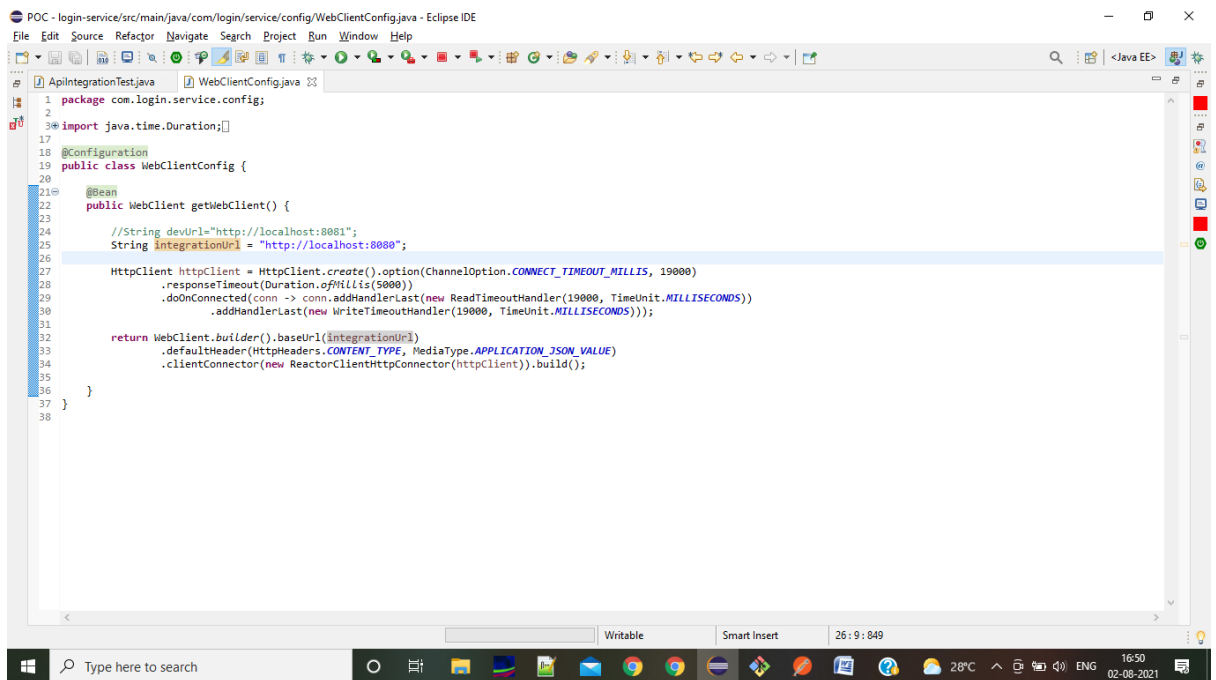

12. For above criteria i need to make these applications (login-service & Wire Mock server) up and running.

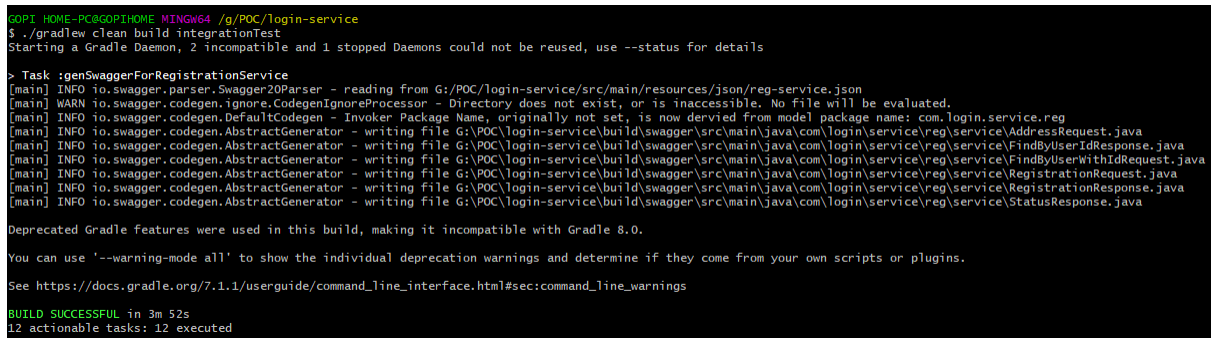

- The screenshot displays the Eclipse IDE interface with the following details:

 - Top Bar:** POC - login-service/src/integ-test/java/com/login/service/ApiIntegrationTest.java - Eclipse IDE
 - Menu Bar:** File, Edit, Source, Refactor, Navigate, Search, Project, Run, Window, Help
 - Toolbar:** Standard Eclipse development tools including file operations, search, and execution.
 - Editor:** Shows the source code of `ApiIntegrationTest.java`. The code includes:
 - Imports: `com.login.service`, `io.restassured`, `org.hamcrest`, `org.junit`, and `java.util`.
 - Class Definition: `public class ApiIntegrationTest {`
 - Annotation: `@Test` and `@DisplayName("testFindByIdRequest")`
 - Method: `void testFindByIdRequest() {`
 - Logic: Uses `io.restassured` to perform an HTTP GET request to `http://localhost:8082/login/v1/findByIdRequest` with a `userId` of `"test1"`.
 - Closing: `}`
 - Bottom Bar:** Writable, Smart Insert, 39: 5: 1156
 - System Tray:** Includes a search bar, taskbar icons, and system clock showing 16:48 on 02-08-2021.

14. In the WebClient configuration class calling the wire mock running url instead of reg-service url,

15. To run the integration test cases we need to run **./gradlew clean build integrationTest**.

16. After running from STS we will see below in STS,
